

# Zeke:

Python Platform for Teaching  
Mathematical Modeling of  
Infectious Disease

---

SciPy 2014

Eric Lofgren, MSPH, PhD

# Acknowledgements

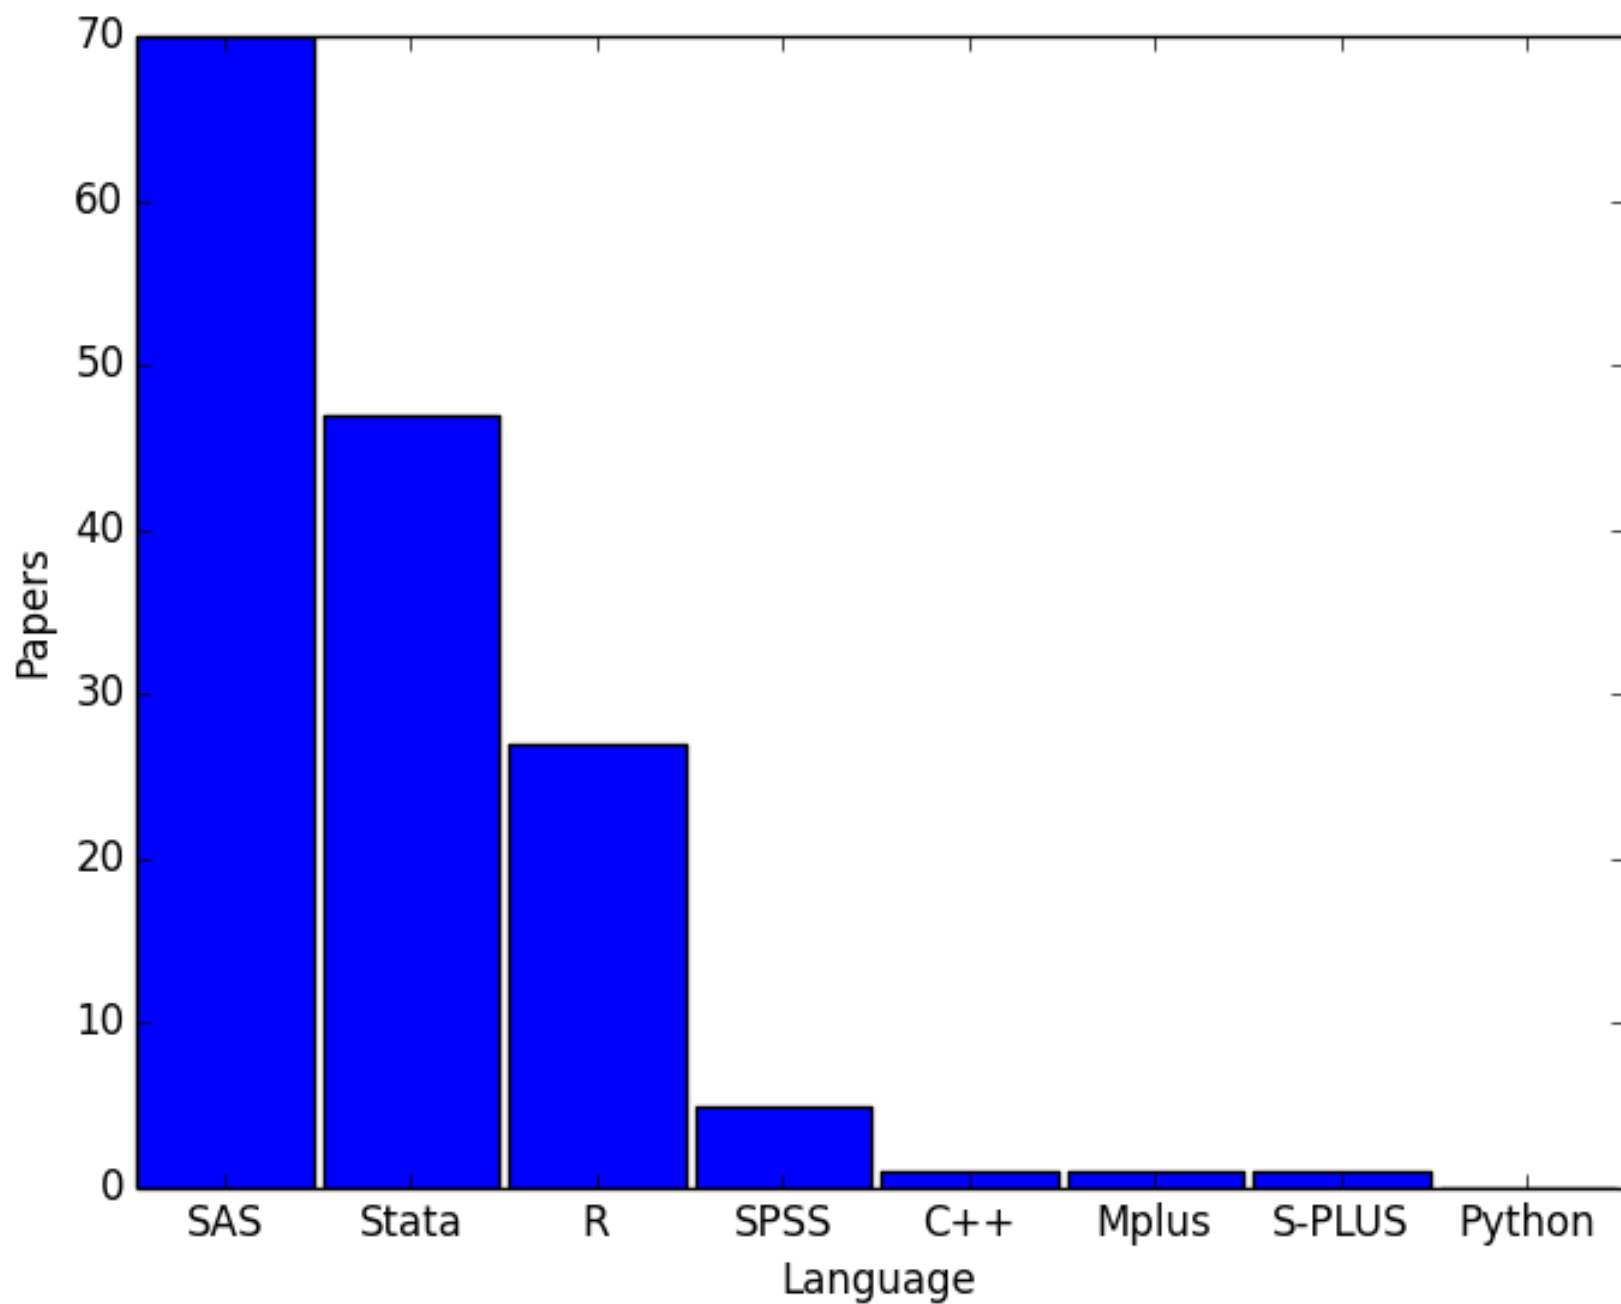

- Collaborators:
  - Alex Clark (ACLARK.NET)
- Funding:
  - National Institutes of Health and National Institute of General Medical Sciences – Models of Infectious Disease Agent Study Grant 5U01GM070694-11
  - Merck IISP

# Background

- Computational Epidemiologist
  - Mostly in Hospital Epidemiology
- Background is from an observational Epidemiology department
  - Lots of stats, less so programming
  - *Zeke* is in many ways retracing my steps

# A Disclaimer

- No brilliant new Python is going to be shown here today

“The goal of *Zeke* is to develop general purpose, transferrable computational science skills. As such, the libraries used should be widely available and in common usage - for example, SciPy for scientific computing functions, and Django as a web front-end, rather than bespoke functions, unless no other option is available.”

- ~~pip install zeke~~
- ~~from zeke import \*~~
- Go see Caitlin Rivers talk on Epipy on Thursday

# Mathematical Models in Epidemiology

- Modeling is an established discipline in public health
  - Bernoulli in 1760 with Smallpox
  - Modern incarnation in the early 1900's: Ross, Reed, Frost, etc.
- An invaluable tool in modern public health
  - Can illustrate difficult concepts
    - Herd immunity
    - Competing/complementary interventions
  - Quantitative research on difficult, expensive or otherwise infeasible questions
    - Vaccines, pandemic planning, etc.

# But How Do We Teach Modeling?

- Public health: Emphasis on interpretation and composition of models
  - Implementation, either analytical or computational, is left as a “black box”
- Math: Emphasis on mathematical analysis of models as dynamical systems problems
- Problems for both:
  - Public health students have only a loose understanding of model implementation and analysis
  - Math students are focused on abstract or mathematically interesting points rather than public health needs
  - Everyone has a two part learning curve, split between programming, theory, and infectious diseases

# Comparison to Observational Epi

## Observational Epi

- Disease-agnostic general toolkit adapted to specific questions
- Very little subject matter expertise needed to use basic methods
- Solid foundation to extend to more complex approaches

	Exposed	Unexposed
Disease	<b>A</b>	<b>B</b>
No Disease	<b>C</b>	<b>D</b>

## Mathematical Epi

- Single-use disease specific tools
- Very high levels of subject matter expertise required to design a useful model
- Models are frequently borrowed, adapted or modified, often incorrectly
- “Malaria is like Dengue is like Yellow Fever is like hospital-acquired MRSA”

# Zombies

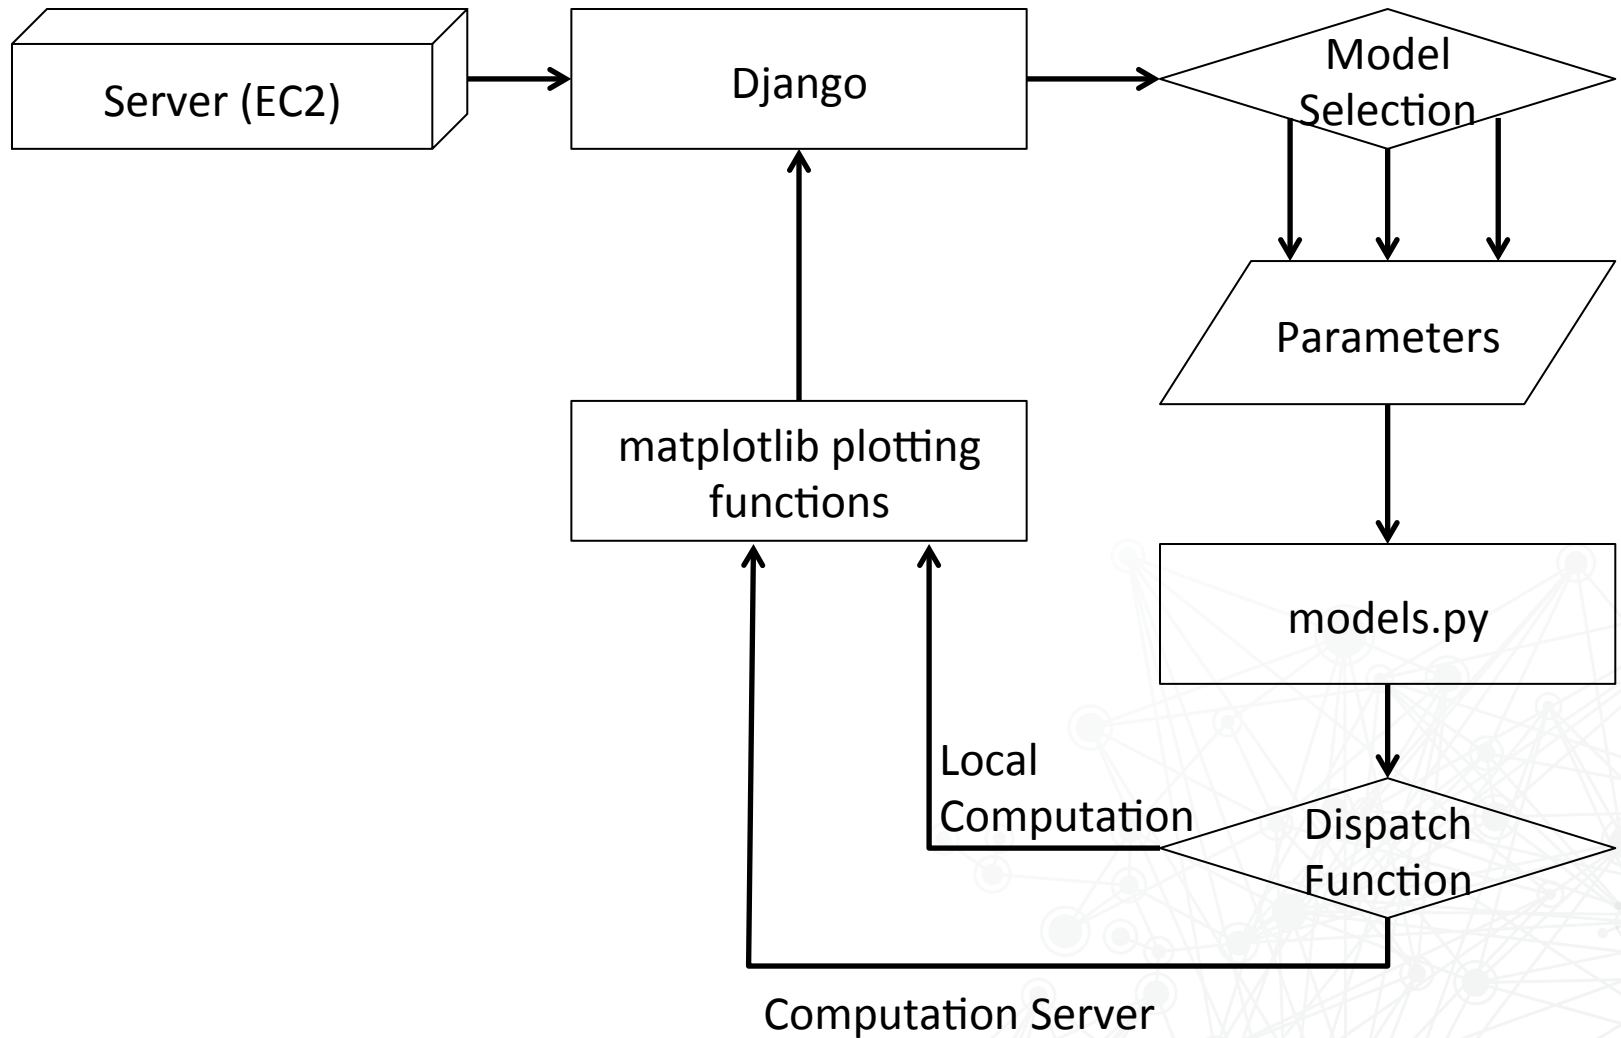

# Why Zombies?

- Familiar, flexible disease system
  - You can become an “expert” with a night of movies
  - Can change model *forms* without changing *parameters*
  - Lots of room exploring model decision making
    - Interventions, fast vs. slow, latent periods, vectors, etc.

# Zeke

- Web-based epidemic modeling interface
  - Hides code unless code is of interest
- Separates disease knowledge, programming skill and theoretical skills development
- As much as possible, models, infrastructure and interface are kept separate
  - Models especially are kept separate

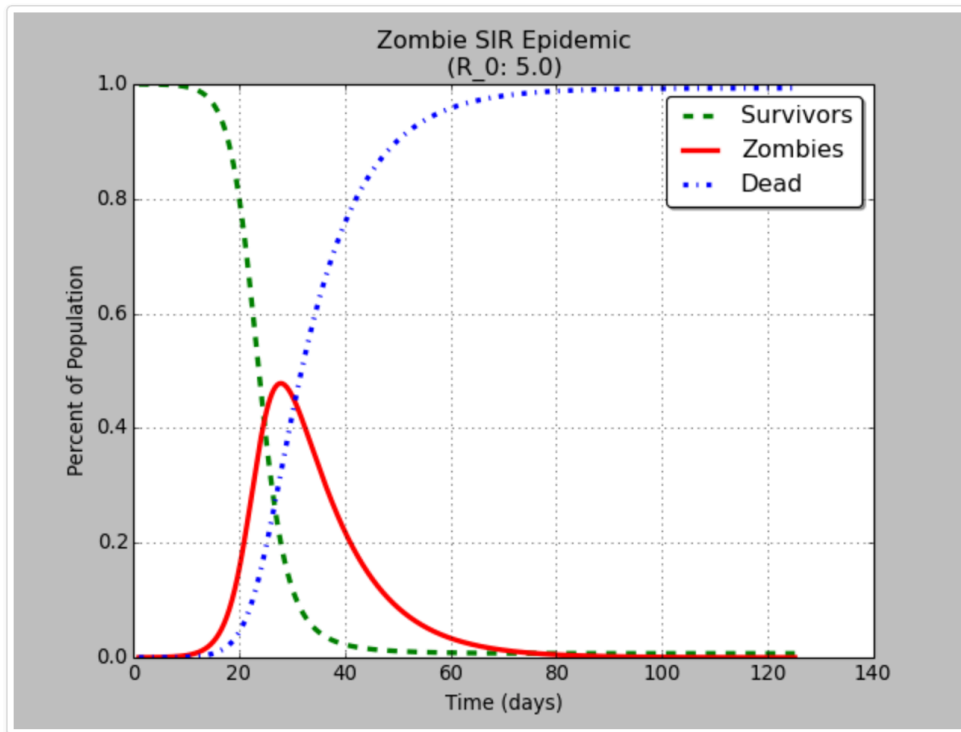

# Demo

## Select a model

SIR

## Controls

Susceptible-Zombie-Dead mathematical model. Takes two arguments:

- Beta: Contact rate
- Gamma: Infection duration in days

Beta

0.5

Gamma

0.1

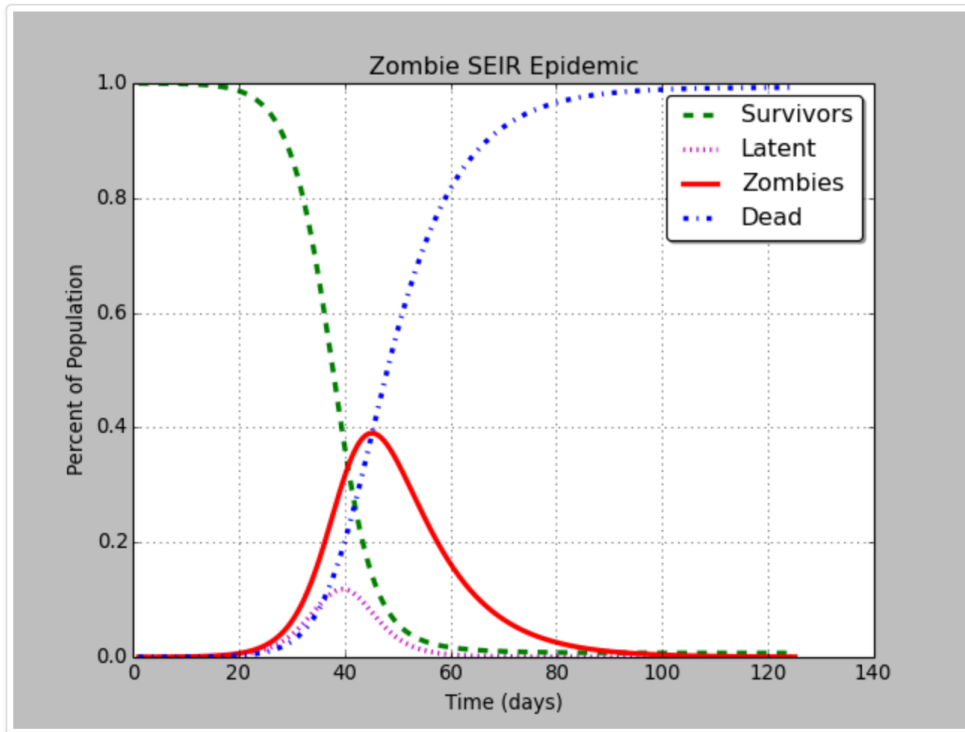

Set values

Reset

## Select a model

SEIR

## Controls

Zombie epidemic model with latent infection period. Takes three arguments:

- Beta: Contact rate
- Gamma: Infection duration in days
- Alpha: A latent (non-zombie infected) period in days

Beta

0.5

Gamma

0.1

Alpha

0.5

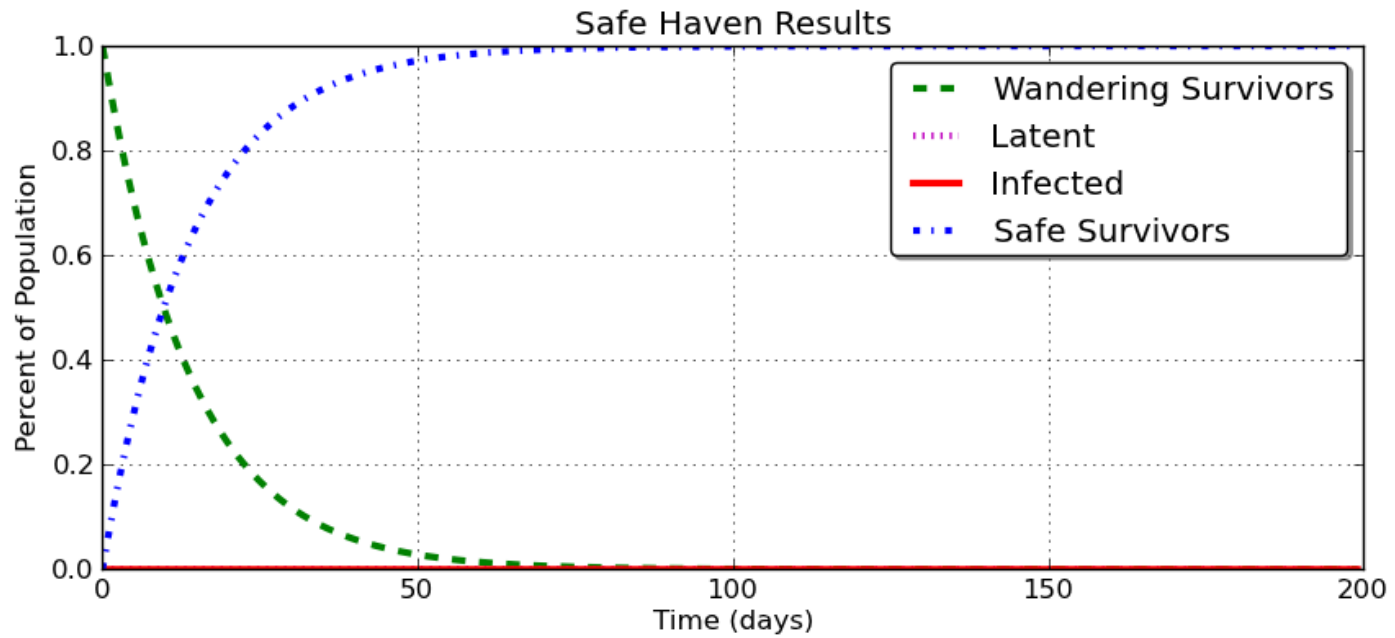

Set values

Reset

Safe Haven

# Future Directions

- **More Models**
  - Stochastic models
  - Curve fitting
  - Network or agent-based models
- Documentation and Testing
- Adaptation as a web-based modeling framework for non-technical users
  - Different fields: Epidemiology, Ecology, etc.
  - “My computer doesn’t work with Doodle”

# Contributing

- Always looking for contributors
  - Also meant to be an approachable project for new open source contributors
  - Nice part about keeping things separate: only work on the bits you want
- [github.com/epimodels/zeke](https://github.com/epimodels/zeke)
- Currently a live deployment at:
  - [www.zeke-project.org](http://www.zeke-project.org)
